

GitHub Agentic Workflows

Automation that Actually Reads the Room

Ari LiVigni - Sr. Learning Advocate

Alejandro Menocal - Sr. Service Delivery Engineer

github.com

The Three Pillars of Agentic Workflows

Markdown-Based Workflows

Write automation in natural language instead of complex YAML. The frontmatter controls the engine and schedule, the body provides the prompt.

AI-Powered Decision Making

Support for Copilot, Claude, and Codex. The agent dynamically adapts to the situation, triaging issues or diagnosing test failures based on actual repository context.

Deep Ecosystem Integration

Native access to GitHub infrastructure. Seamless integration with Actions, Issues, Pull Requests, Discussions, and repository tools.

github.com

The Exercise Blueprint: Automating Mona's Website

1. Mona's Personal Notes

(Raw context)

2. The GitHub Blog

(Industry updates)

3. The GitHub Changelog

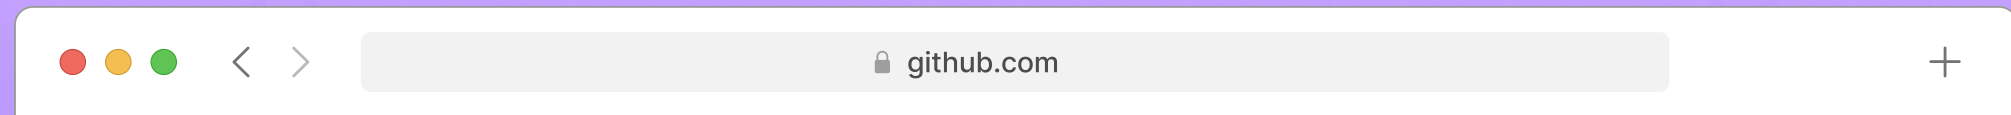

(Feature updates)

Agentic Node:
Analyzes cross-repository context, synthesizes the latest information, and drafts website updates in Markdown.

Safe Output:

A structured Pull Request submitted to Mona's GitHub Info website for human review.

GitHub Skills exercise : Agentic Workflows That Read the Room

1. Scan the code or visit the link.

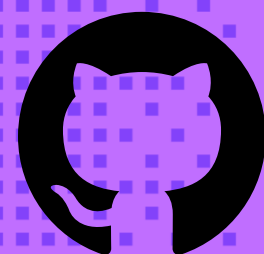

2. Clone the GitHub Skills exercise repository to your GitHub username

3. Empower an AI agent to autonomously design and deploy a website updater workflow, synthesizing various project data to draft intelligent, context-aware pull requests.
